Lab9 (2018-12-2)

董依菡 <u>15302010054@fudan.edu.cn</u>

耿同欣 15302010048@fudan.edu.cn

张星宇 <u>15307110273@fudan.edu.cn</u>

任务

请大家在lab7的基础上完成以下功能

- 除Z型方块外,加入剩下的S,I,O,T,J,L型方块,并能够随机生成下一个方块
- 使用继承与多态的改造方块类。
- pj1中已经使用继承多态的思想的话,可以直接提交pj1
- pj1中如果没有使用继承多态的思想的话,建议阅读提示,并思考这样做的好处,然后进行重构,如果你觉得继承与多态没有用,也可以尝试说服TA,如果TA被成功说服,你也可以交上你的pj1。

提示

以下是一个Block抽象类的示例

```
* class Block, owns 3*3 cells in this lab.
public abstract class Block {
    // use cells to represent the shape of ZBlock
    protected boolean cells[][];
    // rows of cells
    protected int rows;
   // columns of cells
    protected int columns;
    // rowIndex of rotateCenter
    protected float rotateCenterRow;
    // columnIndex of rotateCenterColumn
    protected float rotateCenterColumn;
    // get and set methods
    // todo
     * Constructor of ZBlock, initialize cells with a shape of "Z".
     */
```

```
public Block(int rows, int columns, boolean[][] cells, float
rotateCenterRow, float rotateCenterColumn) {
        this.rows = rows;
        this.columns = columns;
        this.cells = cells;
        this.rotateCenterRow = rotateCenterRow;
        this.rotateCenterColumn = rotateCenterColumn;
    }
    /**
     \boldsymbol{\ast} Get the next cells rotated 90 degrees from current cells.
     * This method will not change the property "cells".
     * @return the rotated cells of current cells
    public boolean[][] nextRotatedCells() {
        // todo
    }
    * rotate cells for 90 degrees.
     */
    public void rotate() {
       // todo
    }
}
public class ZBlock extends Block {
    public ZBlock() {
        super(3,3,new Boolean[][]{{true,true,false},{false,true,true},
{false, false, false}},1,1);
       // todo
    }
    // other methods
   // todo
}
```

提交

提交地址:ftp://10.132.141.33/classes/18/181 程序设计A(戴开宇)/WORK_UPLOAD/lab9 提交内容:将java程序(.java文件)压缩成zip格式,zip压缩包的名称:学号_姓名_lab9.zip 截止止日日期:2018/12/9 23:59:59
